1. Introduction

1.1 What is TCAD

TCAD is a component that will help you write vector graphics applications.
Shapes can be interacted with by mouse or code. It is easy to use, effective and powerful. It will save you valuable time.

If you want add some CAD-Drawing function into application , using OLE mode, it is too tired to understand its concept..., programming it from zero, There is more work waiting for you! Now, You can using TCAD to help you write application.Easy to create and use VECTOR shape in your application developing ,only controled by mouse. Now, You can using TCAD to help you writing application.

Inserting bitmaps to the drawing.

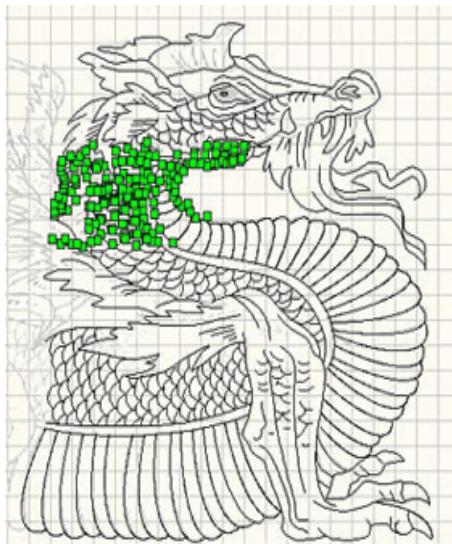

Scaling, rotating, dragging bitmaps like a shape.

Exporting the drawing as WMF,bitmap,Jpg,dxf(R12) file.

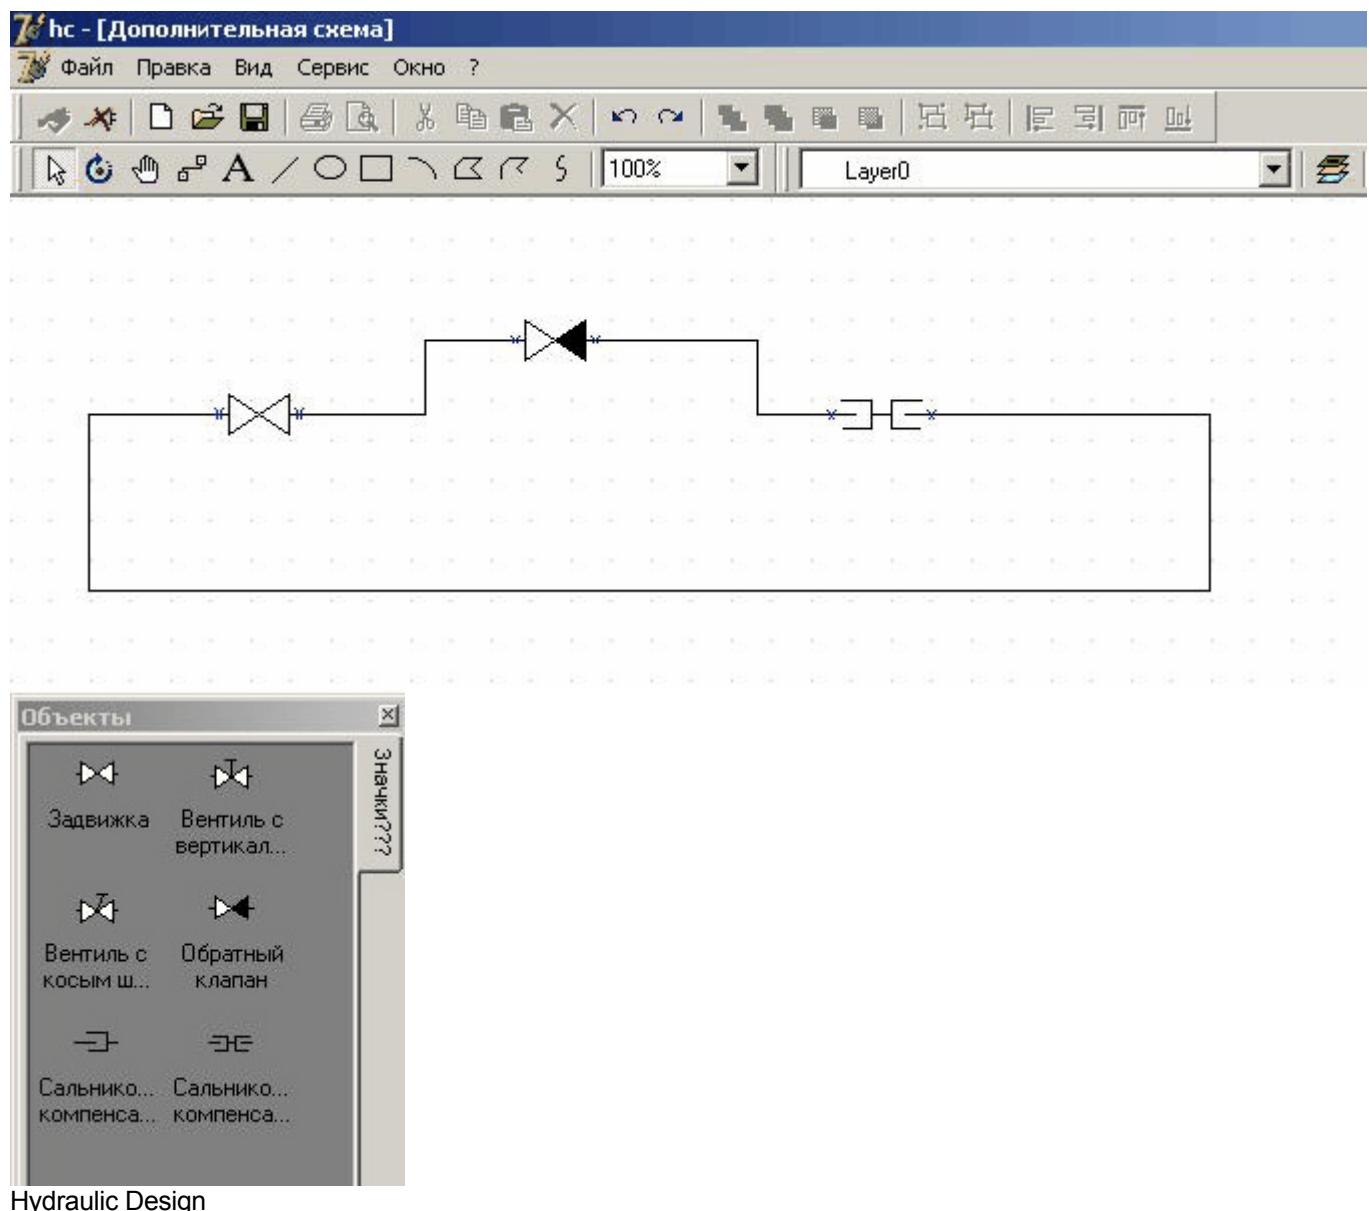

1.2 Application ScreenShot

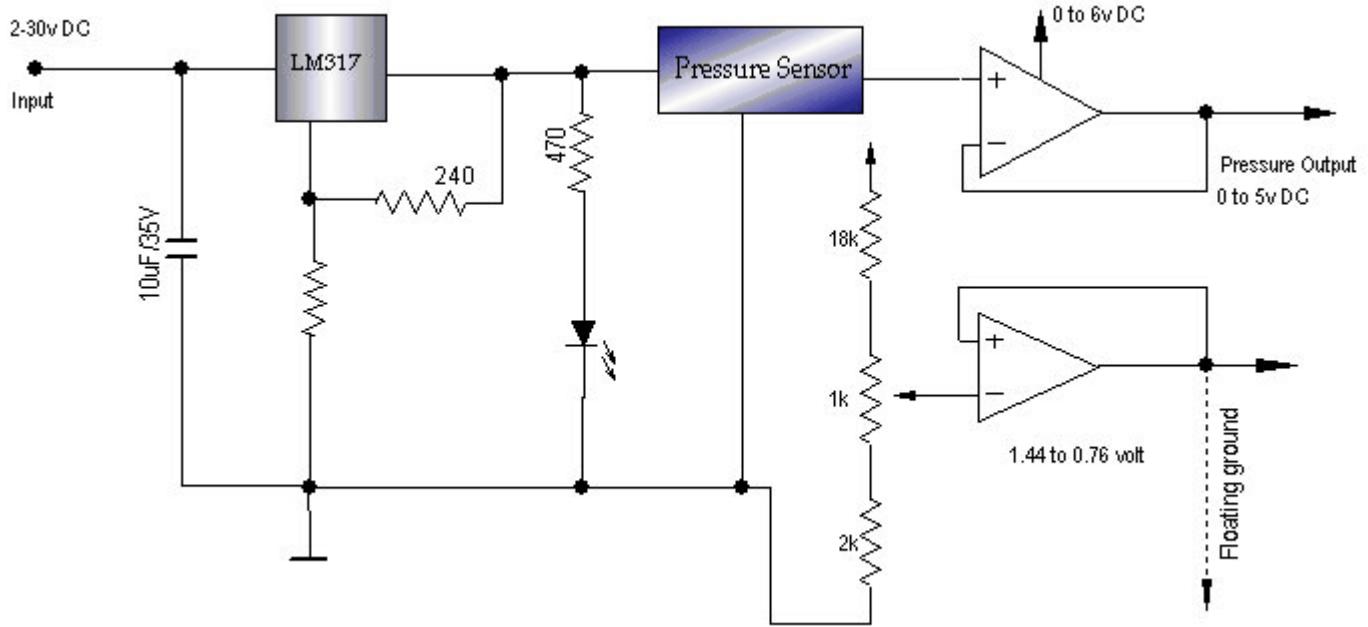

It is a house plan drawing sample,no lib need to draw this,fast and easy.

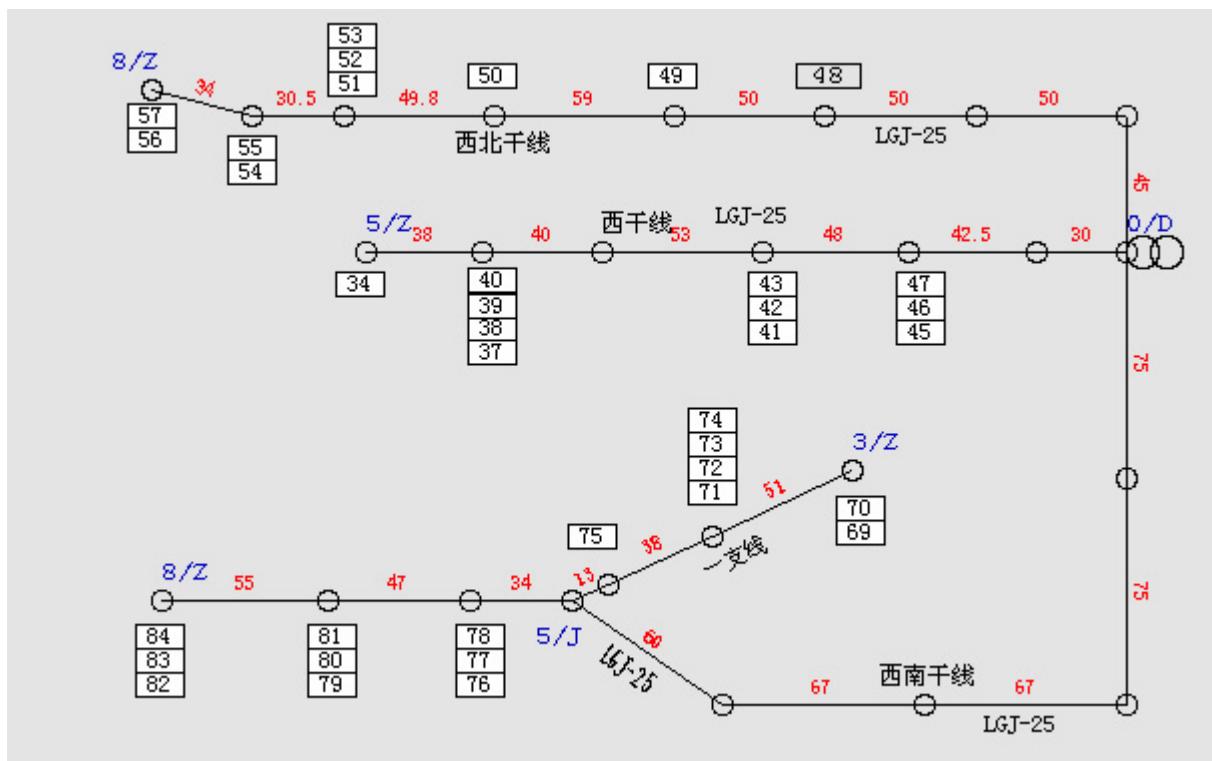

Design of vector drawings from cnc machines .Using TMyElliArc to create this complex dragon.

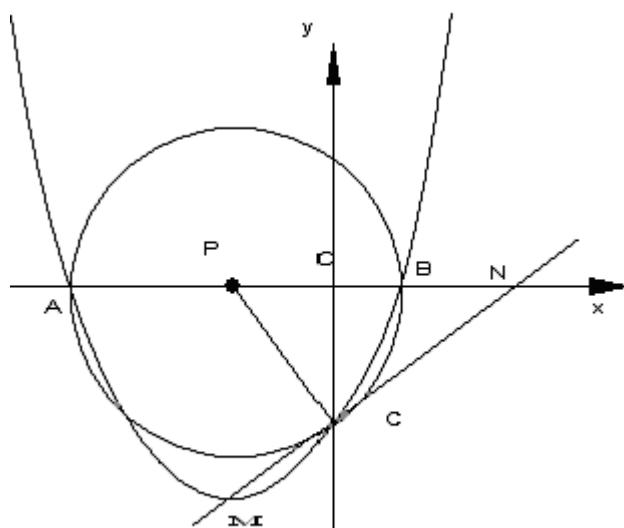

Electric drawing, library need , and support link line, TCAD is a powerful for drawing.

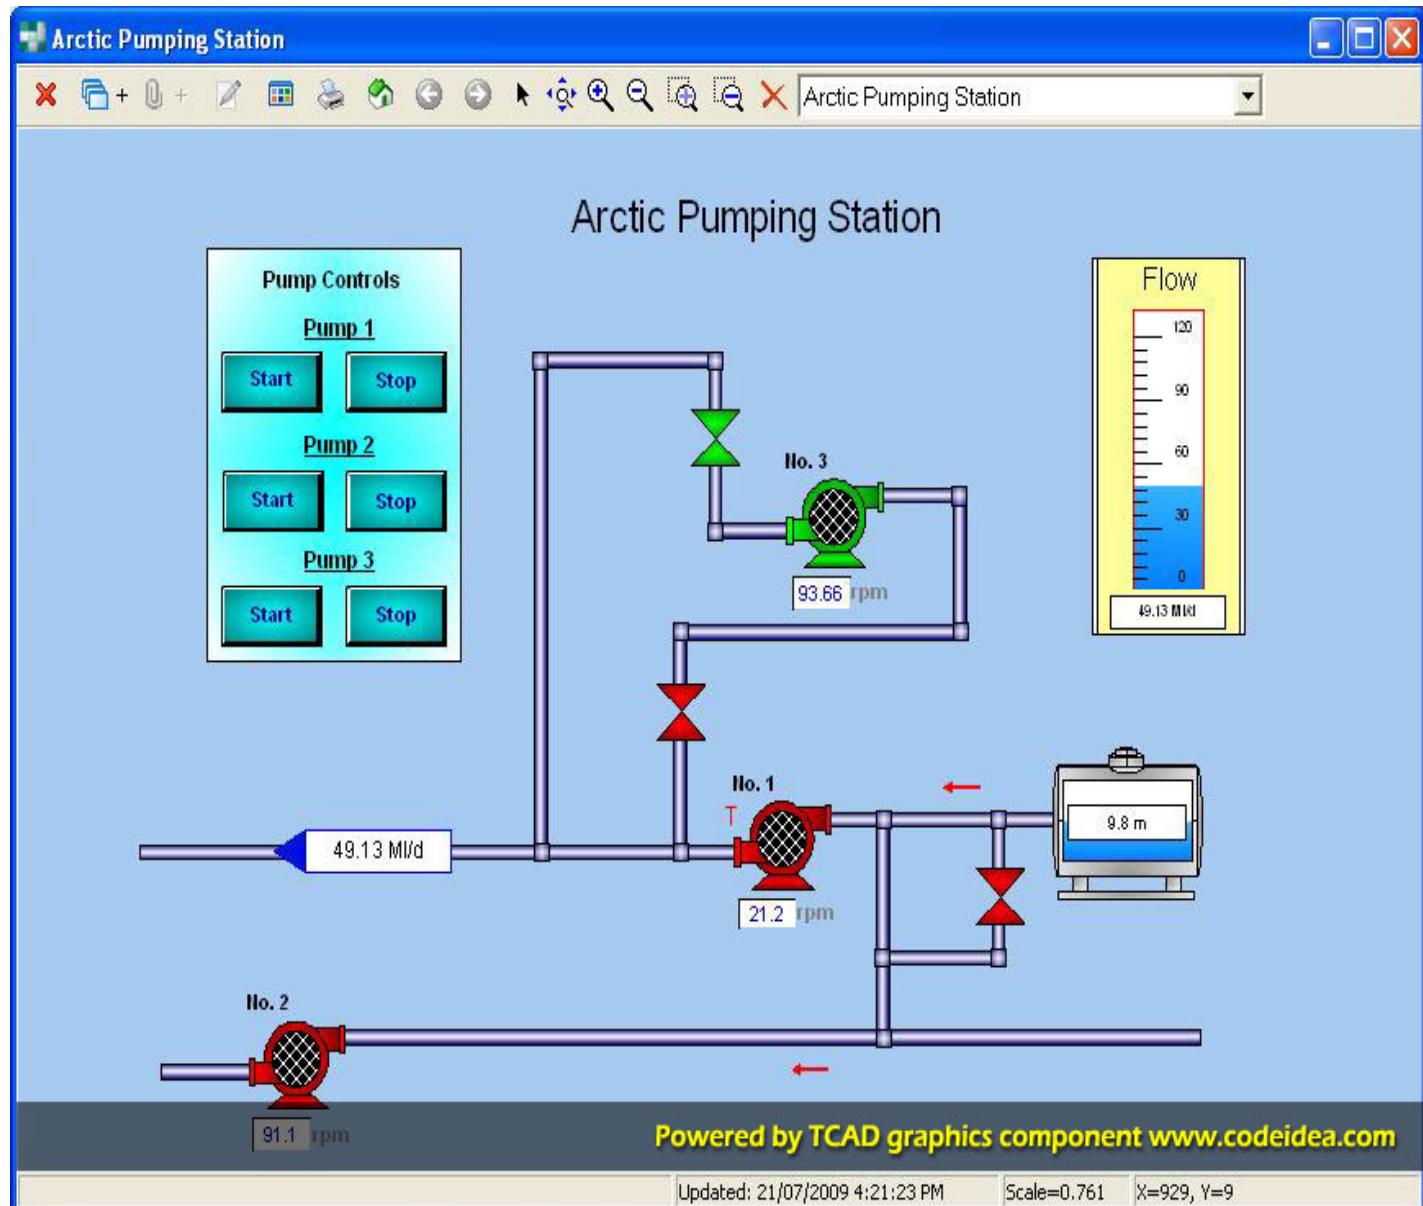

nk line style?

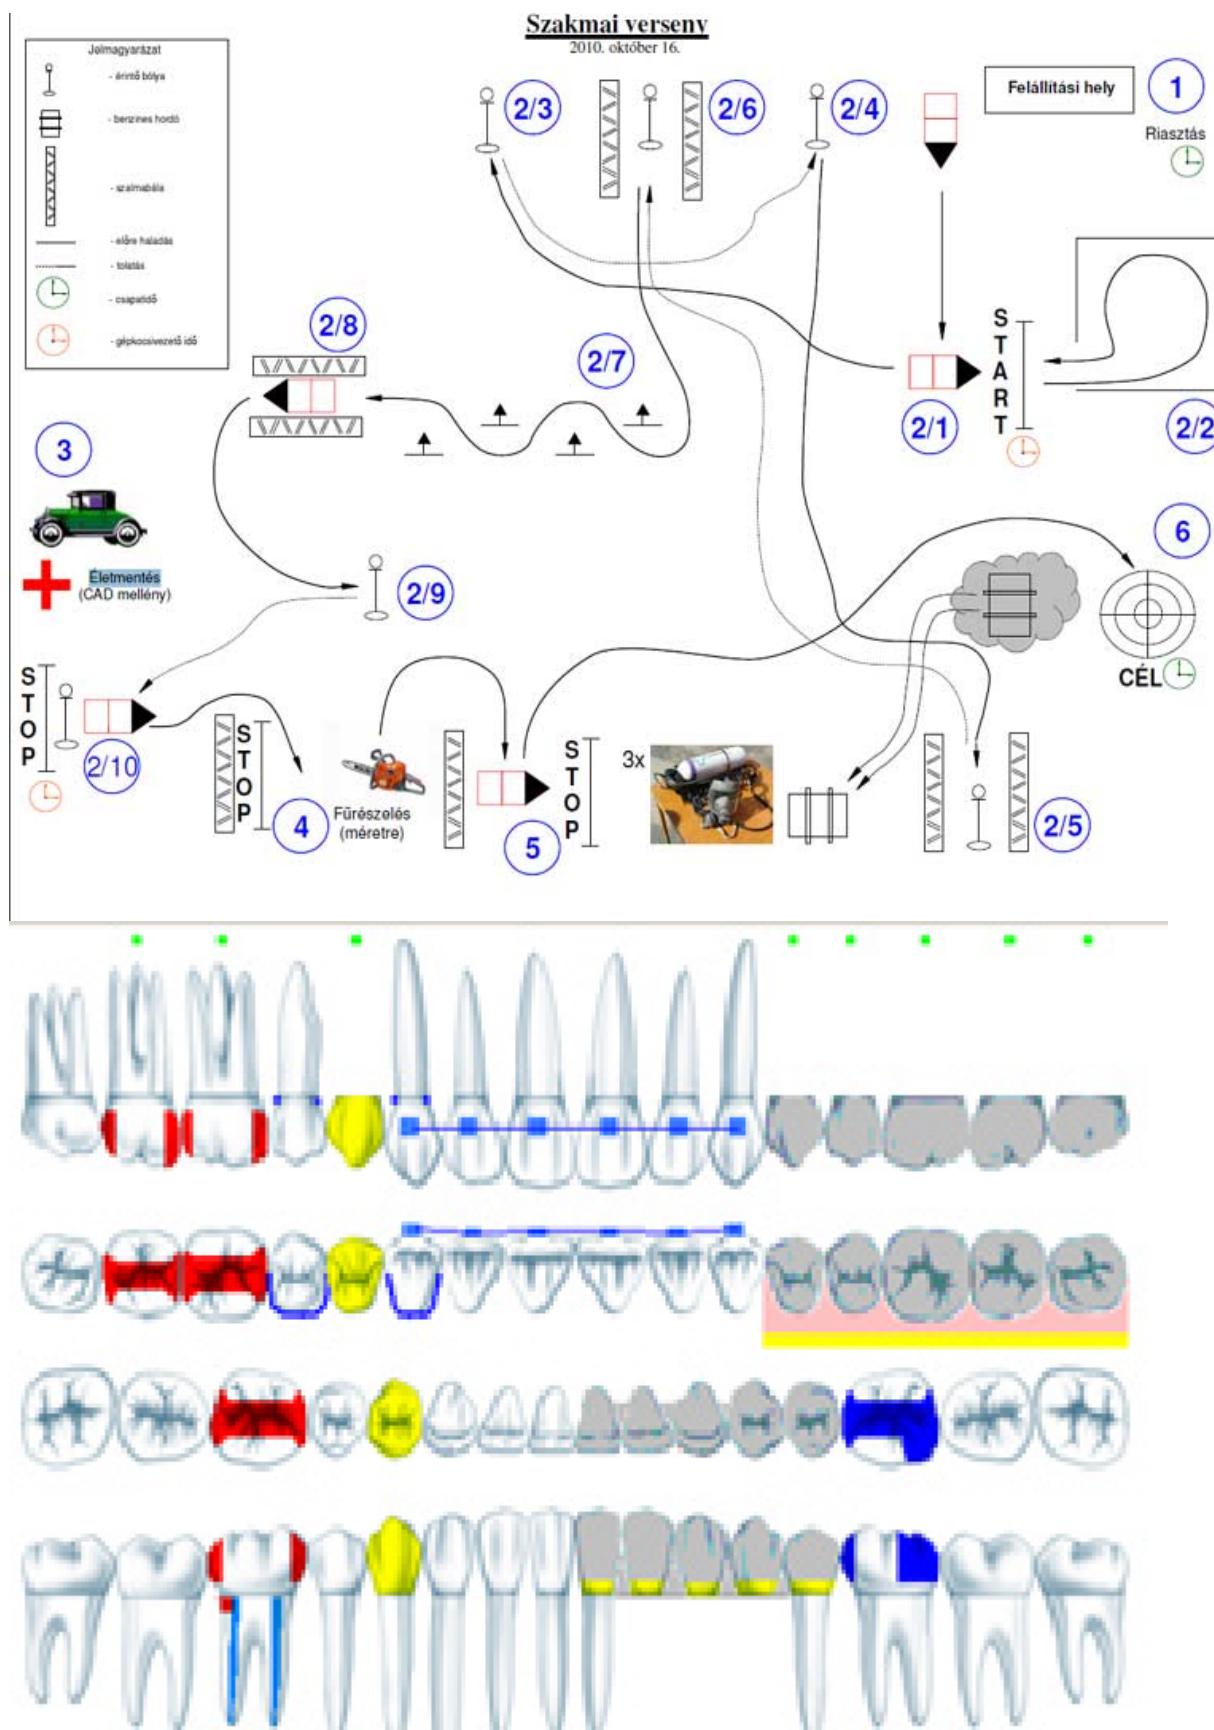

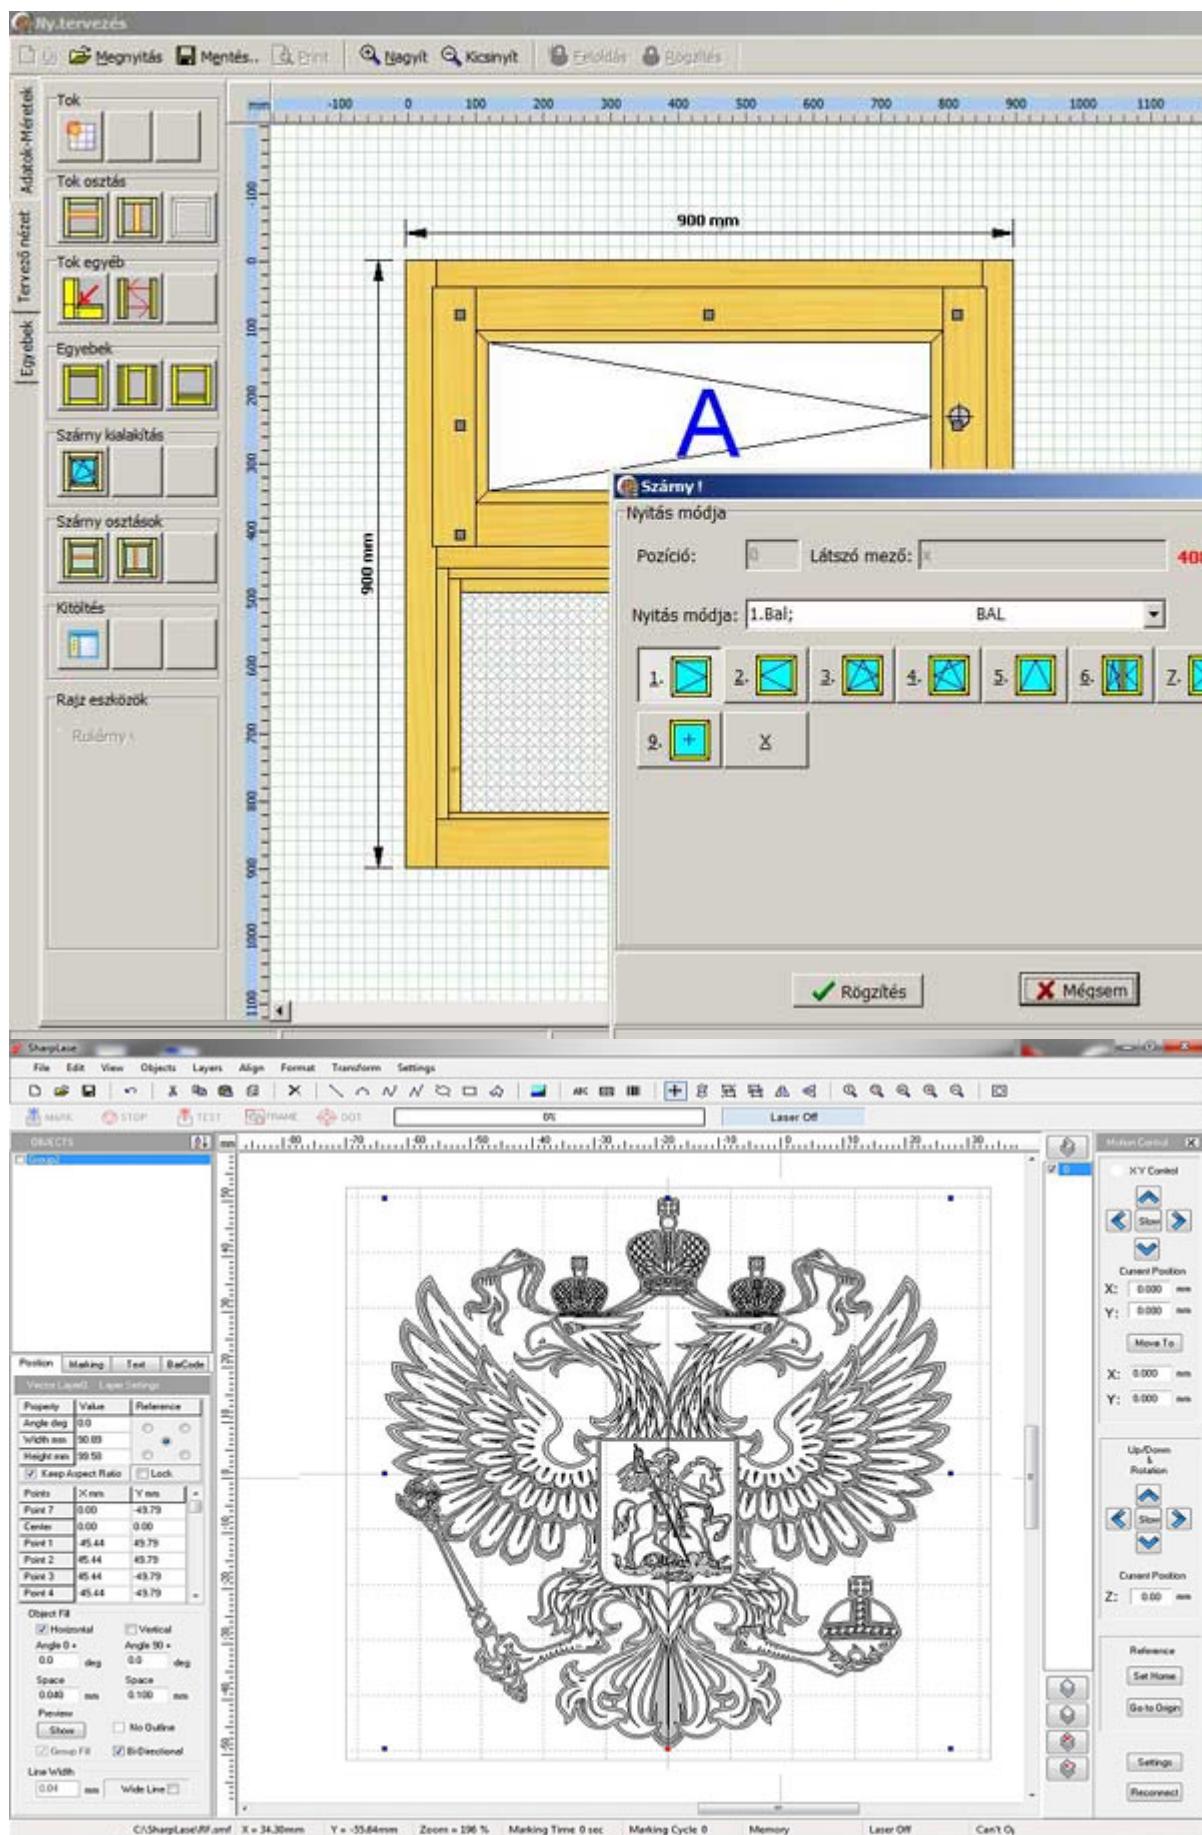

Project:Eletric device manager
Compay:Xi An electric industry college,China

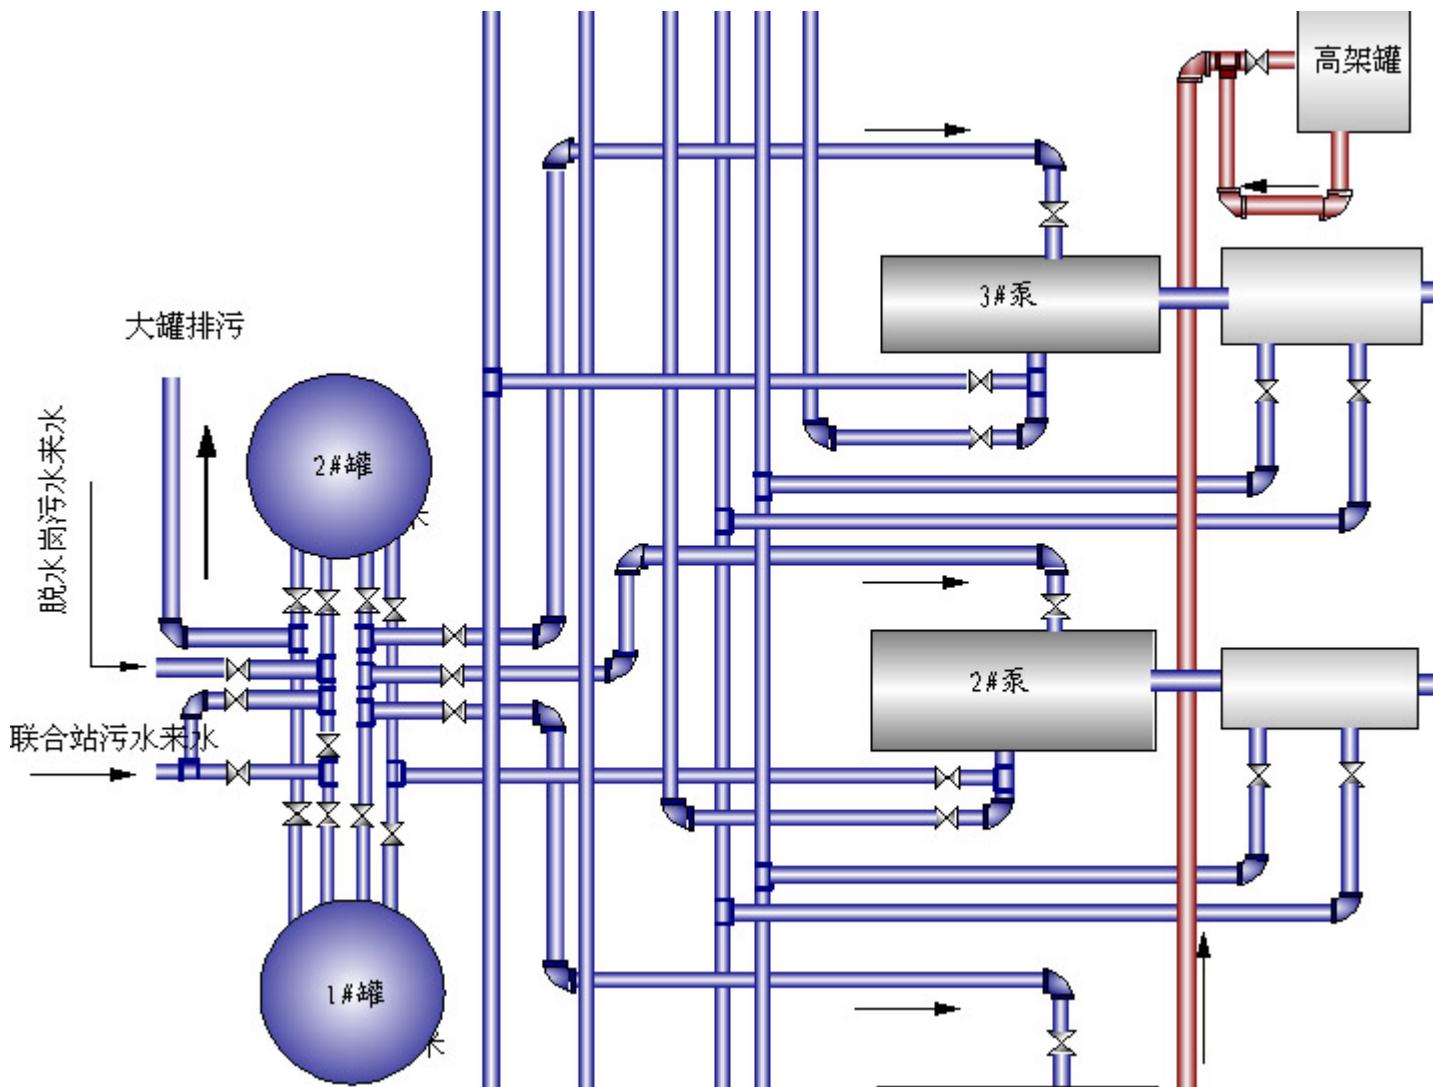

If you are a teacher or student,TCAD can draw math graph,you can copy the graph to MS Word . Creating math graph library,can speed your job.

4.2 Events

4.2.1 OnActionToolToSelecting

TActionToolToSelecting = procedure() of object;

property OnActionToolToSelecting: TActionToolToSelecting

Description:

Use OnActionToolToSelecting to handle when the ShapeTool return to SpSelecting state,

Example:

```
procedure TMainFrm.MyCAD1ActionToolToSelecting;
begin
  SelectBtn.Down := true;
end;
```

4.2.2 OnChildShapeSelected

TChildhapeSelected = procedure (SelectedChildShape: TMyShape; var AcceptSelect:boolean) of object;
property OnChildShapeSelected: TChildhapeSelected

Description:

Use OnChildShapeSelected to handle when you click the combine shape.

Example:

```
procedure TMainFrm.MyCAD1ChildShapeSelected(SelectedChildShape: TMyShape; var
AcceptSelect: Boolean);
begin
  AcceptSelect:=false;
end;
```

4.2.3 OnClick

Please read Delphi or C++ Builder Help file.

4.2.4 OnDbClick

Please read Delphi or C++ Builder Help file.

4.2.5 OnDeleteLayer

TLayerOp = procedure(LayerId: integer; LayerName: string; Visible: Boolean) of object;

property OnDeleteLayer: TLayerop

Parameters:*LayerID*

The id of this layer.

LayerName

The name of this layer.

Visible

This layer is visible or not.

Description:

Use OnDeleteLayer to handler a layer be deleted.

4.2.6 OnDragDrop

property OnDragDrop: TDragDropEvent;

Delphi syntax:

```
type TDragDropEvent = procedure(Sender, Source: TObject; X, Y: Integer) of object;
property OnDragDrop: TDragDropEvent;
```

C++ syntax:

```
typedef void __fastcall (__closure *TDragDropEvent)(System::TObject* Sender, System::TObject* Source, int X, int Y);
__property TDragDropEvent OnDragDrop = {read=FOnDragDrop, write=FOnDragDrop};
```

Description:

Occurs when the user drops an object being dragged.

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

4.2.7 OnDragOver

Occurs when the user drags an object over a control.

Delphi syntax:

```
type
  TDragOverEvent = procedure(Sender, Source: TObject; X, Y: Integer; State: TDragState; var Accept: Boolean) of object;
property OnDragOver: TDragOverEvent;
```

C++ syntax:

```
typedef void __fastcall (__closure *TDragOverEvent)(System::TObject* Sender, System::TObject* Source, int X, int Y, TDragState State, bool &Accept);
__property TDragOverEvent OnDragOver = {read=FOnDragOver, write=FOnDragOver};
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the

value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

4.2.8 OnWholeDragged

TWholeDragOperation = procedure of object;
